

Lencom Fast Email Extractor 7.5 Cracked

4.2.3 Test Procedure

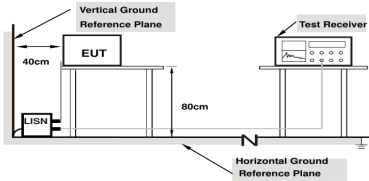

- The EUT was placed 0.4 meters from the conducting wall of the shielded room with EUT being connected to the power mains through a line impedance stabilization network (LISN). Other support units were connected to the power mains through another LISN. The two LISNs provide 50 ohm/ 50uH of coupling impedance for the measuring instrument.
- Both lines of the power mains connected to the EUT were checked for maximum conducted interference.
- The frequency range from 150kHz to 30MHz was searched. Emission levels under (Limit - 20dB) was not recorded.

NOTE: All modes of operation were investigated and the worst-case emissions are reported.

4.2.4 Deviation from Test Standard

No deviation.

4.2.5 Test Setup

The diagram illustrates the test setup in a shielded room. On the left, a LISN is connected to the power mains. The EUT (Equipment Under Test) is placed on a table, with a vertical ground reference plane positioned 40cm from the conducting wall. A horizontal ground reference plane is located 80cm below the EUT. On the right, a Test Receiver is placed on another table, connected to the power mains through a second LISN.

Note: 1.Support units were connected to second LISN.
For the actual test configuration, please refer to the attached file (Test Setup Photo).

4.2.6 EUT Operating Condition

Same as 4.1.6.
